

Samsung Supply Chain Performance Analytics Dashboard -

Problem Statement

Samsung operates a complex global supply chain involving multiple suppliers, warehouses, logistics partners, and sales channels. As operations grow, it becomes difficult to monitor inventory levels, supplier performance, shipment status, and overall supply chain efficiency using raw data alone.

The company requires an interactive analytics solution that can consolidate supply chain data, track key performance indicators (KPIs), identify operational bottlenecks, and support data-driven decision-making.

The objective is to develop a Power BI dashboard that enables stakeholders to:

- Monitor inventory levels to prevent stock-outs and overstocking.
- Evaluate supplier performance based on lead time and delivery reliability.
- Track shipment delays and logistics performance.
- Analyze warehouse utilization and inventory turnover.
- Measure business KPIs such as revenue, profit, perfect order percentage, and defect rate.
- Compare sales performance across different sales channels.
- Provide real-time insights to improve operational efficiency and reduce supply chain costs.
